Exercise:

Design and draw an ER diagram that captures the information about the university. Use only the basic ER model here; that is, entities, relationships, and attributes

Consider the following information about a university database:

• Professors have an SSN, a name, an age, a rank, and a research specialty.

• Projects have a project number, a sponsor name (e.g., NSF), a starting date, an ending date, and a budget.

• Graduate students have an SSN, a name, an age, and a degree program (e.g., M.S. or Ph.D.).

• Each project is managed by one professor (known as the project’s principal investigator).

• Each project is worked on by one or more professors (known as the project’s co-investigators).

• Professors can manage and/or work on multiple projects.

• Each project is worked on by one or more graduate students (known as the project’s research assistants).

• When graduate students work on a project, a professor must supervise their work on the project. Graduate students can work on multiple projects, in which case they will have a (potentially different) supervisor for each one.

• Departments have a department number, a department name, and a main office.

• Departments have a professor (known as the chairman) who runs the department.

• Professors work in one or more departments, and for each
department that they work in, a time percentage is associated with their job.

• Graduate students have one major department in which they are working on their degree.

• Each graduate student has another, more senior graduate student (known as a student advisor) who advises him or her on what courses to take.
